Manhaj Student — Phase 1 Workflow Handover

> **Phase:** 1 (build now), with two deferrals (Practice Quizzes → P2/P3) and one scrap (Well-being check-in → removed). **Who it's for:** the student — from upper primary (goals, study planner) up to senior years (university tracker, Grade 11+). Some teacher/counsellor write-paths reach into these screens; those cross-link to the **Teacher** doc. **How to read this:** §0 = orientation (who the student is, screen-at-a-glance, phasing). §1–3 = one section per Phase-1 screen, each with a plain-English description, the screenshot, a Mermaid workflow, the backend ↔ on-screen mapping, mock data tables, and open questions. §Z = build task-allocation + data-to-source tables. **Companion docs:** `handover_phase1_teacher.md` (rubric scoring, assessments, goal-setting input surface, class summaries, quiz builder), `handover_phase1_parent.md` (monthly report, permission slips), `handover_phase1_admin.md` (timetable, enrolment, consent). Governing spec: `handover-assets/_SHARED_SPEC.md`. Style template: `admin_v1_build_handover.md`.
>
> Diagrams are **Mermaid** — they render as pictures on GitHub and in the PDF build. If you see raw code, open in a Mermaid-aware viewer.

---

0. Archetype summary

Who the student is, in one paragraph. The student is the only Manhaj user who logs in to act on *their own* record rather than someone else's. In Phase 1 they do three things: (1) **set and track personal monthly goals** — sometimes alone, sometimes co-set with a teacher or counsellor; (2) **plan their week** — see classes, homework and tests pulled from the rest of the platform, and accept a suggested afternoon study block; and (3, senior years only) **run their university applications** — a structured replacement for the spreadsheet-and-email mess, with predicted grades, school-validated test scores, personal statements, teacher references, and a "where you stand" panel built on the school's own leaver outcomes. Everything the student sees is **read-mostly** off data other roles already produce (timetable, assessments, rubric, attendance); the genuinely *new* student-owned write surfaces are goals, study-block edits, and the university application records. AI is kept deliberately small — it **suggests** goals and study blocks and (in the university screen) drafts/feedback under counsellor review; it never auto-scores a student.

Phase-1 screens at a glance

Screen	Purpose	Key data it READS	Key data it WRITES	Links to
S1 · My Goals	Set + track monthly goals; celebrate wins	`rubric_scores`, `assessment_results`, `attendance_marks` (for computed progress); rubric weak-axis (for AI suggestions)	`student_goals` (NEW), `goal_checkins` (NEW), `goal_reflections` (NEW), `ai_usage_ledger` (goal-suggestion cost)	**Teacher** doc — teacher/counsellor goal-set surface writes the same `student_goals` table; **Parent** monthly report reads goals + reflection
S2 · Study Planner / My Week	One weekly view of classes + homework + tests; suggested study block	`timetable_slots`, `assessments`, homework (assessment kind= `homework`), `student_goals` (behind-goals), `rubric_scores` (weak areas)	`study_blocks` (NEW — only the drag-adjusted plan)	**Teacher** doc (assessments/homework entry); **Admin** doc (timetable as source); S1 (behind-goals feed suggestions)
S3 · University Tracker	Manage senior applications: unis, grades, statements, references, outcomes	`student_goals`, predicted grades, validated test scores, `student_enrollments` (grade gate)	`applications` (NEW), `application_grades` (NEW), `personal_statements` (NEW), `teacher_references` (NEW), reads `university_outcomes` (NEW)	**Teacher** doc (references author; predicted-grade sign-off); **Admin** doc (grade validation, leaver-outcome backfill)

Phasing snapshot

Item	Phase	Why (one line)
S1 · My Goals	**Phase 1**	Core student-agency surface; backend pieces all confirmed OK by founder.
S2 · Study Planner	**Phase 1**	Mostly aggregates existing data; only new write is the drag-adjusted study block.
S3 · University Tracker	**Phase 1 (heavy)**	Wanted in P1 but needs the most new tables, a grade-validation flow, and a **research task** (university benchmark data).
AI **goal suggestions** (in S1)	Phase 1	The *only* AI in S1 — suggests goals from rubric weak axes; nothing else needs AI.
AI **study suggestions** (in S2)	Phase 1	Heuristic + light AI ordering of study sessions; the suggested afternoon must change per selected week.
University **match model + essay feedback** (in S3)	Phase 1 (gated)	Heavy AI; starts as a weighted regression on the school's outcome backfill, essay feedback always counsellor-reviewed.
Practice Quizzes (S4 — deferred to Phase 2, no section here)	**Phase 2**	Paired with the Teacher **quiz builder (T4)** — the question generation lives there; build the two together.
Practice-quiz **adaptive difficulty**	**Phase 3 (open)**	A build-approach question (ELO vs Bayesian); per-topic accuracy must derive from class data + Teacher class-summaries (T3). Linkage to be figured out.
Well-being check-in	**SCRAPPED**	Founder asked to remove it entirely — not in P1, P2 or P3. Treated as removed; mockup kept for reference only, no table built.

> **On the two deferrals:** when the Phase 2/3 docs are written, they must explicitly output *what to consider if Practice Quizzes is built separately from goals/study-planner*, so the cross-links (auto-progress on behind-goals; suggesting a practice block in the planner; per-topic accuracy sourced from the class + T3 class-summaries) stay clean. See §1 and §2 "Deferred to P2/P3" notes.

---

1. S1 — My Goals *(student screen S1)*

What it is. The student's monthly goal board: a few goals across academic / behaviour / personal / subject categories, each with a progress bar, a streak where relevant, and an attribution line ("set by you" / "set with Mr. Tariq"). A "Goals Manhaj suggests" block proposes new goals drawn from the student's rubric weak axes, and a private monthly reflection field feeds the parent report. The important data-model point: a goal can be **created by the student OR by a teacher/counsellor**, and per-goal **progress is computed on read** — it is never stored.

My goals · May

What you're working on this month. Set a few, track your progress, celebrate the wins.

You're on track with 4 of your 5 goals.
Big week — your **maths quiz score (92%)** hit your "90% quiz" goal. And you read every day for 12 days straight!

5 ACTIVE · 2 DONE · 12 DAY STREAK

ACTIVE GOALS

+ Add a goal

Score 90%+ in every maths quiz
✓ DONE
ACADEMIC · May · 4 quizzes

4 of 4 quizzes hit — 100%

Highest quiz score this month: **92%** on chapter 4 — top of class!

Set with **Mr. Tariq** · See history · Set next month's →

Read for 30 minutes every day
PERSONAL · Self-reported · daily check-in

12-day streak — keep going! — 92%

Streak: **12 days** · longest streak ever: 14 days · don't break the chain!

Set by **you** · ✓ Tick today

Help 1 new classmate each week
COLLABORATION · Linked to your rubric · self + teacher checked

3 of 4 weeks this month — 75%

Ms. Sara noticed you helping the new student at lunch on Thursday — that counts!

Set with **Ms. Reem** (counsellor) · Add this week

عر Master all 60 chapter-6 Arabic words
ARABIC · Self-quizzed · ~10 a week

54 of 60 words mastered — 90%

Almost there — just 6 more words to go. You're ahead of schedule!

Set with **Ms. Maryam** · Practise now · Mark words

Get better at multi-step word problems
MATHS SKILL · Practice 5 a week · 10 weeks

14 of 25 problems done · slightly behind — 56%

Try **2 more** this weekend to catch up — Mr. Tariq has 5 new problems waiting.

Set with **Mr. Tariq** · See problems · Try one now

GOALS MANHAJ SUGGESTS

Based on your rubric scores · pick what feels right

Two ideas worth thinking about
Drawn from your May rubric — places where a small focus could grow your score

Practise explaining your maths thinking out loud
Your "communication of reasoning" axis is your lowest — and the easiest to improve quickly. Mr. Tariq could pair you with a younger student once a week to explain a problem.
+ Add this as a goal →

Try one Arabic short story a week
You're crushing vocabulary — try connecting it. Reading short stories will help fluency more than another word list.
+ Add this as a goal →

QUICK REFLECTION

Private to you and Mr. Tariq · saved with your monthly report

WHAT WENT WELL THIS MONTH?

Maths is starting to make more sense, especially fractions. I felt proud about the chapter 4 quiz. Reading every day has helped my vocabulary.

Last saved **just now** · only you, Mr. Tariq, and your parents can see this · Save reflection

My Goals

Visual summary · Backend & data · The mockup

Open mockup full-screen ↗

1 · VISUAL SUMMARY

What this screen is

Self-directed monthly goals across academic, behavioural, personal, and subject-specific categories — with progress tracking, streaks, AI suggestions, and a private reflection field.

WHO IT'S FOR

Students from upper primary upward, owning their own learning.

WORKFLOW IT SUPPORTS

Builds student agency. Goals are co-set with teachers (Mr. Tariq, Ms. Reem) or self-set, tracked monthly, celebrated when hit.

KEY FEATURES

- Recognition hero card ("on track with 4 of 5 goals")
- Active goal cards with progress bars, streaks, partner-teacher attribution
- Done badges with trophy-tone for completed goals
- Behind-goal cards framed actionably ("try 2 more this weekend to catch up"), never punitively
- AI-suggested goals drawn from rubric weak areas
- Private monthly reflection with stated audience (you, teacher, parents)

2 · BACKEND & DATA

What it takes to build this for real

Data inputs, backend services, AI role, and privacy considerations.

INPUT DATA REQUIRED

- Student-set goals + teacher-set goals
- Per-goal progress data (auto-tracked where possible: quiz scores, homework, reading streak)
- Self-checked items (reading streak, helping classmate)
- Rubric weak-axis (for AI suggestions)
- Past month's reflection (for trend)

BACKEND BUILD REQUIRED

- goals table with type, target, progress, owner (student / teacher / shared)
- Auto-progress trackers per goal type (quiz score, completion %, streak counters)
- Manual check-in mechanism for self-reported goals
- AI suggestion engine drawing from rubric scores
- Monthly reflection storage (private to student, teacher, parents per privacy settings)
- Auto-feeds parent monthly report and student growth view

AI ROLE

Light-medium: AI suggests new goals based on rubric scores. Doesn't auto-score goal progress.

PRIVACY & ACCESS

Student-first. Default audience: student + class teacher. Parents see goals only if student opts in.

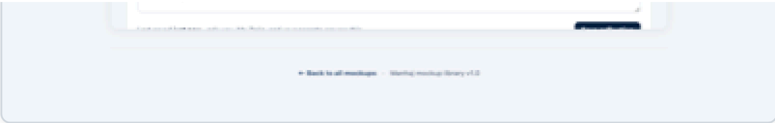
QUICK REFLECTION · Private to you and Mr. Tariq · saved with your monthly report

WHAT WENT WELL THIS MONTH?

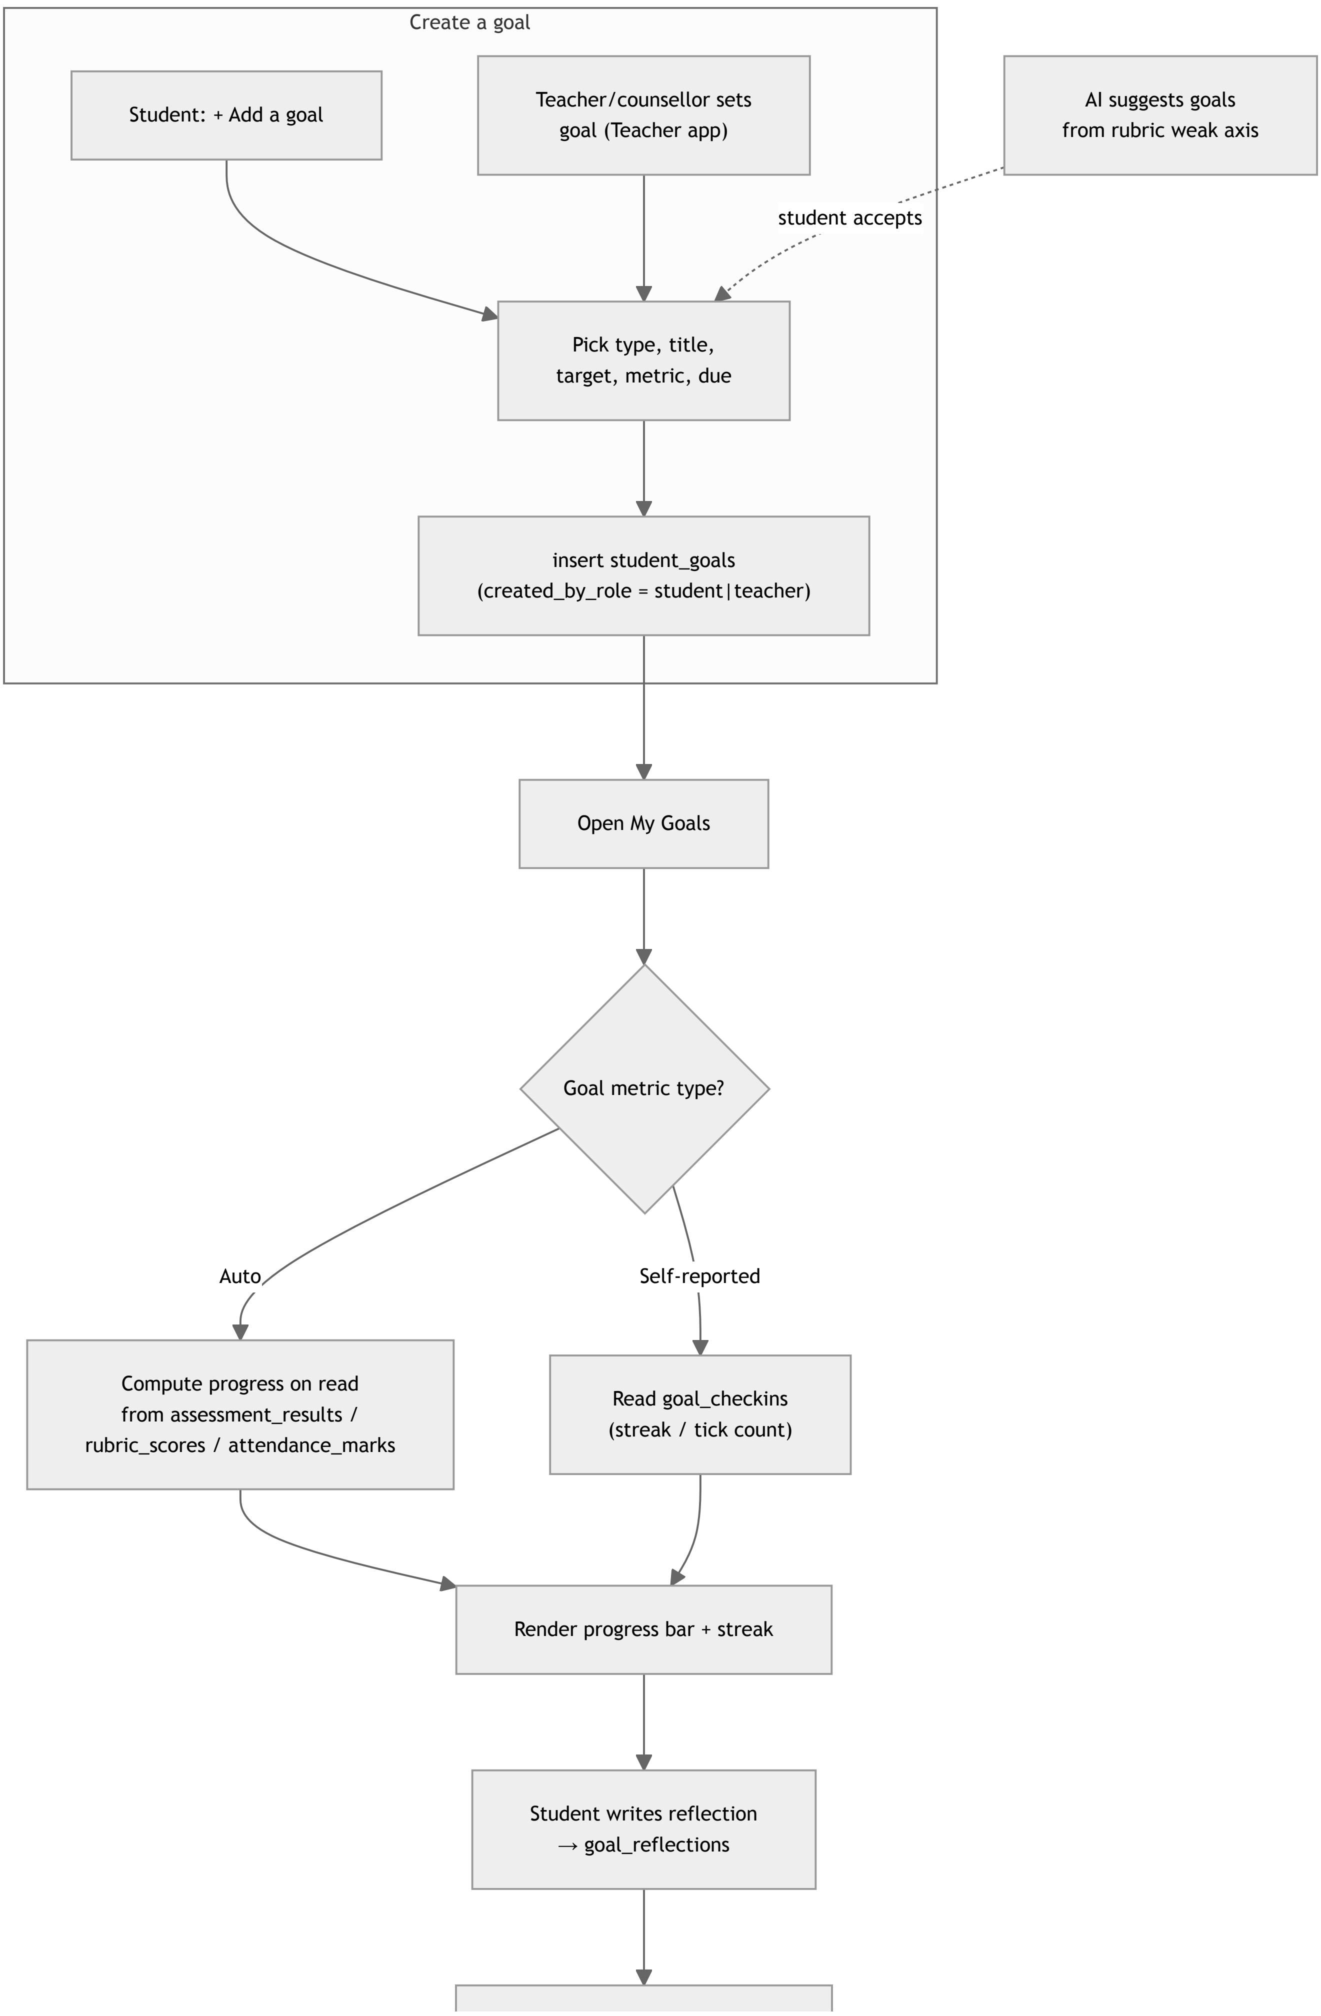
Maths is starting to make more sense, especially fractions. I felt proud about the chapter 4 quiz. Reading every day has helped my vocabulary.



Who uses it & permissions.

- **Student** — creates/edits/archives their own goals, ticks self-reported check-ins (reading streak, "helped a classmate"), writes the reflection. Default audience: student + class teacher; **parents see goals only if the student opts in**.
- **Teacher / counsellor** — can *create a goal for* the student (writes the same `student_goals` row with `created_by_role='teacher'`). This input surface lives in the **Teacher app** and is documented in the Teacher doc; it is the same table from the other side.
- **Parent** — read-only, opt-in, via the monthly report (Parent doc).

Workflow.



Create a goal
Student: + Add a goal
Teacher/counsellor sets goal (Teacher app)
AI suggests goals from rubric weak axis
student accepts
Pick type, title, target, metric, due
insert student_goals (created_by_role = student|teacher)
Open My Goals
Goal metric type?
Auto
Self-reported
Compute progress on read from assessment_results / rubric_scores / attendance_marks
Read goal_checkins (streak / tick count)
Render progress bar + streak
Student writes reflection → goal_reflections

Feeds Parent monthly report
+ student growth view

Backend & data linkage (step by step).

1. **Creating a goal** — the student form (or the teacher-side form in the Teacher app) calls `createGoal(...)`, writing one **`student_goals`** (NEW) row. `created_by_role` is `student` or `teacher`; `created_by_id` is the user/teacher id. The on-screen "Set by **you**" / "Set with **Mr. Tariq**" footer renders directly from these two columns.
2. **Progress is computed, never stored.** On every page load the server resolves each goal's `metric` against the underlying spine:
    - *quiz/test target* (e.g. "90%+ in every maths quiz") → query **`assessment_results`** joined to **`assessments`** (kind/subject) → "4 of 4 quizzes hit · 100%".
    - *rubric-linked behaviour* ("help 1 classmate/week") → read **`rubric_scores`** (axis `participation`) + optionally **`behaviour_notes`** for the "Ms. Sara noticed…" evidence line.
    - *attendance/effort* → **`attendance_marks`**.
    - *self-reported* (reading streak, word-mastery) → count **`goal_checkins`** (NEW) rows. This is the founder's "auto progress tracker" + "manual check mechanism": the system picks auto vs manual based on `metric`.
3. **AI suggestions (the only AI here).** A light call reads the student's lowest **`rubric_scores`** axis for the month and proposes 1–2 goals ("practise explaining your maths thinking out loud"). The student must accept — AI never inserts a goal directly. Cost logged to **`ai_usage_ledger`** (existing).
4. **Reflection** writes **`goal_reflections`** (NEW), audience-scoped (student + teacher + opt-in parent). It is read by the Parent monthly report and the student growth view.
5. Every create/edit writes **`audit_log`** (existing).

Front-end ↔ table mapping.

On-screen element	Source
Goal card title / metric / due	`student_goals.title / metric / due_on`
"Set by you" / "Set with Mr. Tariq"	`student_goals.created_by_role + created_by_id`
Progress bar % + "4 of 4 quizzes hit"	**computed on read** from `assessment_results` / `rubric_scores` / `attendance_marks` / `goal_checkins`
Streak ("12-day streak")	derived from `goal_checkins`
"Done" badge	`student_goals.status = 'met'` (set when computed progress hits target; enum is `on_track` | `at_risk` | `met` | `missed`)
"Goals Manhaj suggests"	AI call over `rubric_scores` weak axis → `ai_usage_ledger`
Reflection text	`goal_reflections.body`

Data tables (mock data — student: Layla Al-Habsi, G10; household: Mr Al-Habsi, Layla G10, Omar G7, Yasmin G3).

> Note: names shown in `student_id` / `created_by_id` columns (e.g. `layla`, `tariq`) are display stand-ins for the uuid FK.

`student_goals` *(NEW)*

id	student_id	title	metric	target_value	created_by_role NEW	created_by_id	status	due_on	created_at
g1	layla	Score 90%+ in every maths quiz	`assessment_pct`	90	teacher	tariq	met	2026-05-31	2026-05-01
g2	layla	Read 30 minutes every day	`self_streak`	30	student	layla	on_track	2026-05-31	2026-05-01
g3	layla	Help 1 new classmate each week	`rubric_axis:participation`	4	teacher	reem	on_track	2026-05-31	2026-05-01
g4	layla	Master all 60 ch-6 Arabic words	`self_count`	60	teacher	maryam	at_risk	2026-05-31	2026-05-01
g5	layla	Get better at multi-step problems	`self_count`	25	teacher	tariq	at_risk	2026-06-30	2026-06-01

`goal_checkins` *(NEW — self-reported ticks; the only place progress for manual goals is stored)*

id	goal_id	checked_on	value	source
c1	g2	2026-05-31	1	student
c2	g4	2026-05-28	10 (words)	student
c3	g5	2026-05-30	2 (problems)	student

`goal_reflections` *(NEW)*

id	student_id	month	body	audience
r1	layla	2026-05-01	"Maths is starting to make more sense, especially fractions…"	student+teacher+parent

> Note: there is **no `progress` column** on `student_goals` — "100%", "75%", "56%" in the mockup are all computed at read time. This is a deliberate founder decision (progress derives from underlying truth, so it can never drift out of sync).

Deferred to P2/P3. None for S1 itself. (The "Practise now" button on the Arabic goal *links* to Practice Quizzes, which is P2 — see §2 deferral note.)

Open questions.

- Goal cadence — fixed monthly cycle, or arbitrary `due_on` per goal? (Mockup mixes monthly and 10-week goals.)
- Parent opt-in default — per-goal or one global toggle?
- When a teacher-set and a student-set goal overlap, do we de-dupe or allow both?

---

2. S2 — Study Planner / My Week *(student screen S2)*

What it is. A single weekly view that *aggregates* the student's life: classes (from the timetable), homework due and tests (from teacher assessments), special events, and a "today's focus" list — plus a **suggested afternoon study block** the student can drag to adjust. Almost nothing here is new data; the planner is a read-and-arrange surface over the rest of the platform. The one genuinely student-owned write is the drag-adjusted study plan.

Study Planner — My Week

Visual summary · Backend & data · The mockup

Open mockup full-screen ↗

1 · VISUAL SUMMARY

What this screen is

Combined view of student's school week, homework due, study suggestions, and time-blocked afternoon plans — designed for upper primary / lower secondary.

WHO IT'S FOR

Students managing their own study time.

WORKFLOW IT SUPPORTS

Replaces "I'll do homework whenever" with a visible weekly plan. AI suggests study sessions tied to upcoming tests and goal gaps.

KEY FEATURES

- Stats row: homework due, tests this week, special events, free afternoons
- Today's focus card (urgent vs done)
- 5-day calendar grid (Sun–Thu GCC school week)
- Per-day strips: classes, due items, study blocks, events (colour-coded)
- AI study suggestions with 'why' explanations ("Mr. Tariq has 5 worked examples for Thursday's test")
- Suggested time-block afternoon plan with free time explicitly protected

2 · BACKEND & DATA

What it takes to build this for real

Data inputs, backend services, AI role, and privacy considerations.

INPUT DATA REQUIRED

- Student's class schedule (from timetable)
- Homework due dates (from teacher assignments)
- Upcoming tests (from teacher entries)
- Calendar events (school + class)
- Student goals (for tying study to goal gaps)
- Per-subject weak-area data (from rubric)

BACKEND BUILD REQUIRED

- Combined schedule view across data sources
- Study suggestion engine (test-prep + goal-gap + topic-due heuristics)
- Time-block engine that respects student's typical free time vs study time pattern
- Drag-to-adjust UI on time blocks

AI ROLE

Medium: AI prioritises study suggestions based on test proximity, goal status, and weak-area focus.

PRIVACY & ACCESS

Student sees own only. Teachers and parents may see if shared. Counsellor sees if flagged.

3 · THE MOCKUP

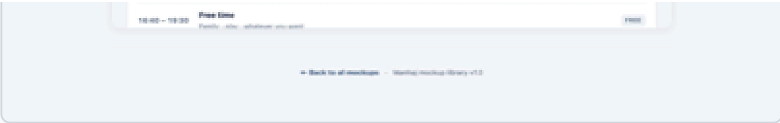
16:20 – 16:40	**Multi-step problems** — 3 problems · 20 min · catches you up on your monthly goal	STUDY

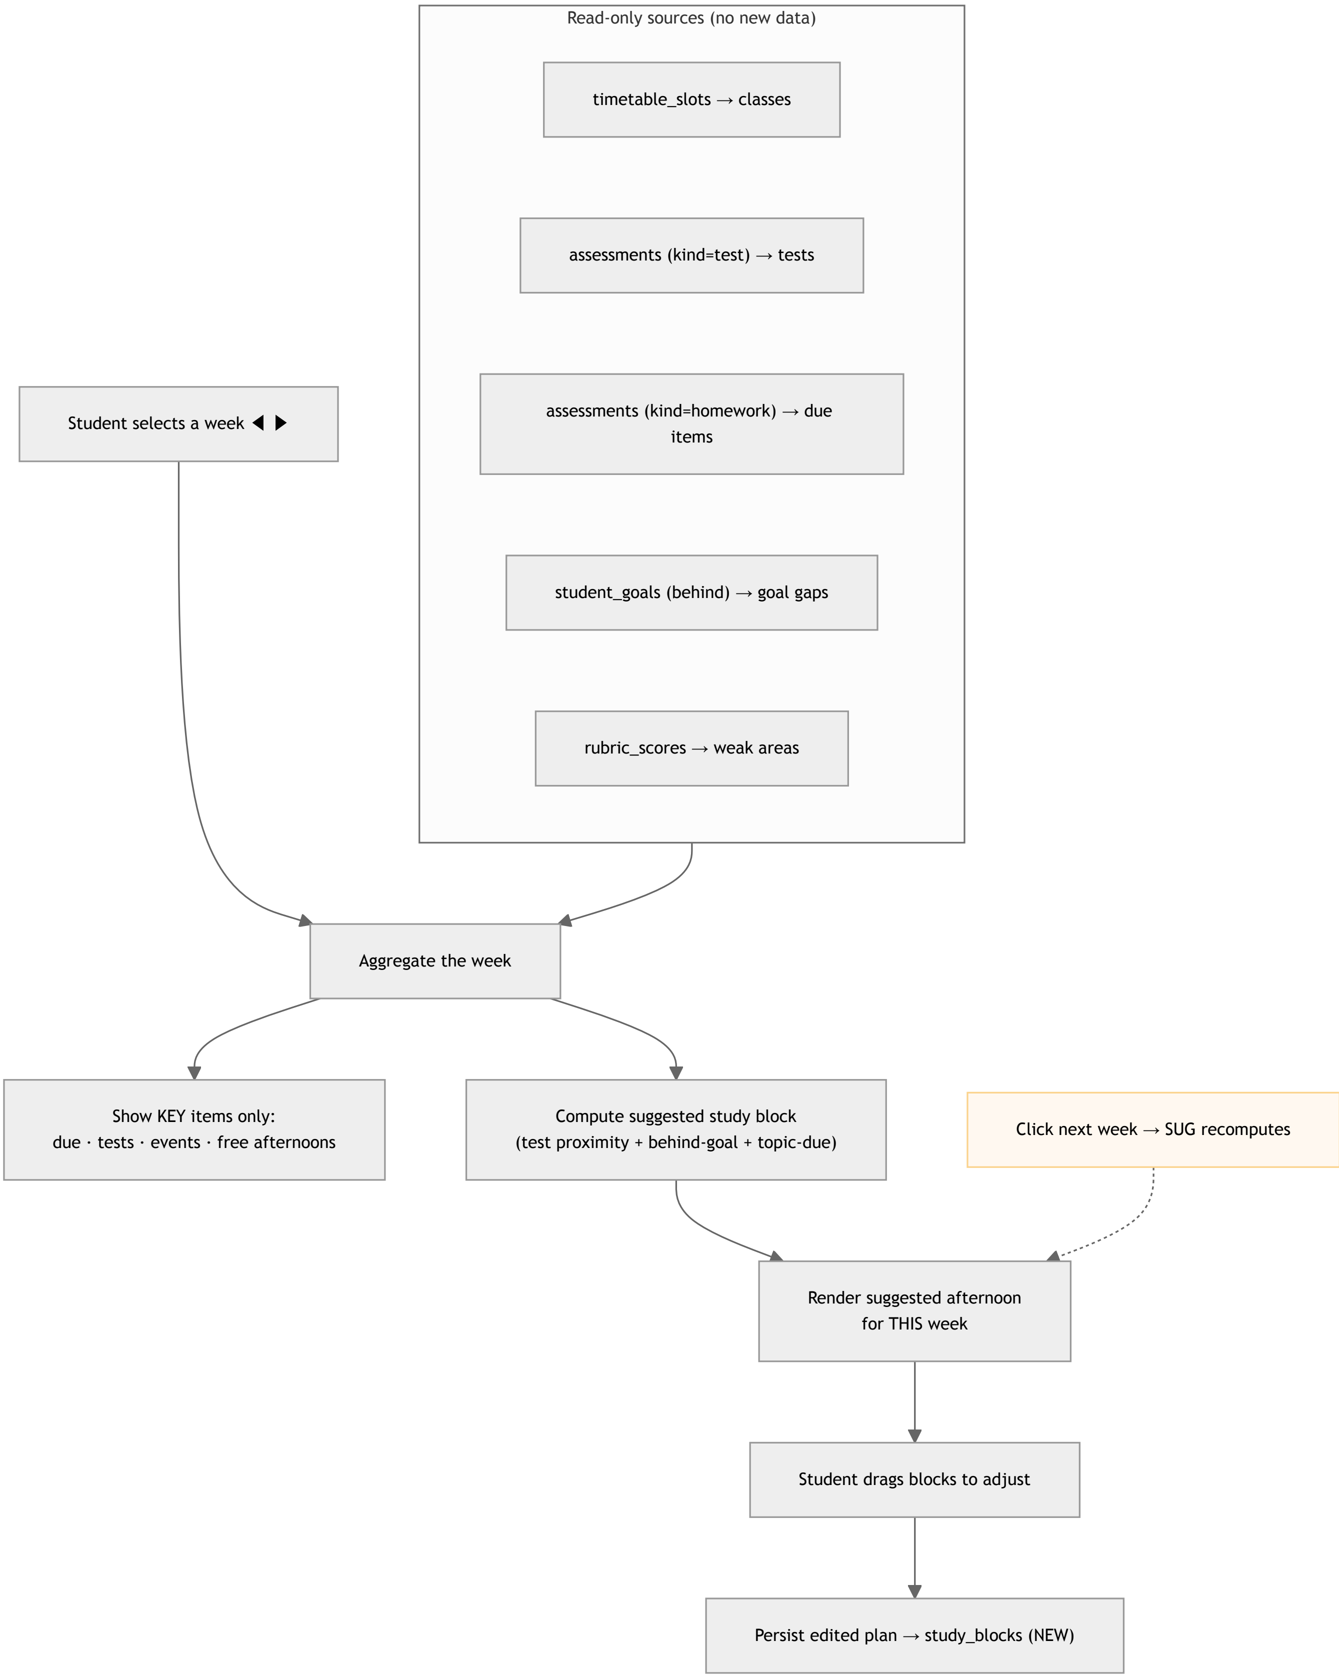


Who uses it & permissions. Student only (own view). Teachers/parents may see it if shared (P2 concern, not built now). The data it reads is produced by teachers (assessments/homework) and admin (timetable).

Founder steers applied here.

- **Drag-to-adjust UI on time blocks** — the suggested afternoon is a *starting* plan; the student drags blocks to reorder/resize, and only *that* edited arrangement is persisted (`study_blocks`).
- **"This week" view shows only the KEY things** — not every class. Surface: homework *due*, *tests*, *special events*, and the *suggested study block(s)*. Routine classes render as light context, not the focus. (The four stat tiles — homework due / tests / events / free afternoons — are the "key things" summary.)
- **The suggested afternoon must CHANGE per selected week** — as the student clicks Week ◀ ▶, the suggestion recomputes against *that* week's tests, due dates and behind-goals. It is not a static block.

Workflow.



Backend & data linkage (step by step).

1. **Read the week.** For the selected week, query **`timetable_slots`** (the student's section → classes per `bell_period`), **`assessments`** where `kind='test'` and `held_on` in-week (the "MATHS CHAPTER TEST · Thursday"), and `assessments` where `kind='homework'` with `held_on` = due date (the "3 homework due"). Special events come from the school calendar (`terms` /event source). This is "most input data comes from other visuals."
2. **Distil to KEY items.** The four stat tiles and the day-strips show only *due / test / event / study* chips — routine recurring classes are de-emphasised. Implementation: filter the aggregate to items with a deadline, an assessment, an event, or a study suggestion.

3. **Compute the suggested study block** with a small ranking engine over three heuristics: *test proximity* (Thursday's maths test → "30 min test prep, best Tuesday evening"), *behind-goal* (S1 goal g5 is 11 problems behind → "2 problems Sunday"), *topic-due / almost-done* (Arabic goal g4 has 6 words left). The output time-block plan (08:00 school → study → free → read) is generated for the **selected** week; clicking to the next week reruns this against that week's tests/goals, so the suggestion **changes per week**.
4. **Drag-to-adjust + persist.** Only the student's *edited* arrangement is saved to **`study_blocks`** (NEW: student, date, start/end, label, kind, origin= `suggested|edited`). The raw timetable/assessment data is never duplicated — `study_blocks` holds only the study/free overlay the student arranged.
5. AI role is **medium**: it orders/justifies the suggestions ("why: test prep"); the heuristics + the read queries do the heavy lifting. Logged to `ai_usage_ledger` .

Front-end ↔ table mapping.

On-screen element	Source
Day-strip class chips ("Maths · P2 · Mr. Tariq")	`timetable_slots` × `bell_periods` × `teachers`
"MATHS CHAPTER TEST · Thursday"	`assessments` (kind= `test`)
"Homework due: 3" / due chips	`assessments` (kind= `homework`)
"Behind goal" study suggestion	`student_goals` + `goal_checkins` (computed gap)
Suggested afternoon time-blocks	computed; persisted edits → `study_blocks` (NEW)
Free-afternoon protection	derived (gaps left after due/test/study)

Data tables (mock — Layla, week Sun 31 May → Thu 4 Jun).

`study_blocks` *(NEW — only the student's arranged study/free overlay is stored)*

id	student_id	block_date	start	end	label	kind	origin NEW
sb1	layla	2026-05-31	15:00	15:30	Finish Science project	study	suggested
sb2	layla	2026-05-31	16:00	16:20	Maths worksheet	study	edited
sb3	layla	2026-06-02	18:00	18:30	Maths test prep	study	suggested
sb4	layla	2026-05-31	19:30	20:00	Read (daily goal)	study	suggested

Read-only inputs (already in schema, shown for traceability):

Source row (example)	Table	Renders as
Maths, section 10A, P2, Mr. Tariq	`timetable_slots`	"Maths · fractions intro · P2"
"Maths chapter test", kind=test, held_on 2026-06-04	`assessments`	"MATHS CHAPTER TEST · Thursday"
"Science project", kind=homework, due 2026-06-01	`assessments`	"Science project DUE"

Deferred to P2/P3.

- **"Practise now" / suggesting a practice session as a planned block** → depends on **Practice Quizzes (P2)**. *Linkage to keep clean if built separately:* the planner's study-suggestion engine should be able to emit a `study_blocks` row of kind `practice` that deep-links into a Practice Quiz topic. When the P2 doc is written, specify the contract (topic id + reason) so the planner doesn't need to know quiz internals.

Open questions.

- Free-time protection rule — fixed (e.g. always leave one free afternoon) or learned from the student's pattern?
- Drag persistence — does an edited block "stick" if the underlying timetable changes next week, or reset to a fresh suggestion?
- Sharing — is the planner ever visible to a parent/teacher in P1, or strictly private?

---

3. S3 — University Application Tracker *(student screen S3)*

What it is. The senior student's application command centre: a pipeline (Researching → In Progress → Submitted → Interview → Admitted/Rejected), per-university cards with status / fit-tag / match-score / deadline / document progress, a master-docs and test-scores rail, personal-statement drafts, teacher references, and a **"where you stand"** placement panel built from the **school's own historic leaver outcomes** compared to **university-sourced benchmark data**. This is Phase 1 but the **heaviest** build — most new tables, a grade-validation flow, and a **research task** (§Z) to source the university benchmark data.

Visual.

PLACEMENT INSIGHTS · WHERE YOU STAND

From ISO's last 3 years of applicant outcomes · only you and Ms. Hala see this

YOUR PROFILE VS ISO Y12 COHORT

Top 18%

Predicted IB 43 · SAT 1480 · IELTS 8.0 · strong activities · solid references

3-YEAR ISO BASE RATES · CS PROGRAMMES

UCL CS	32% admit
King's CS	58% admit
McGill CS	64% admit
NYUAD CS	14% admit

WHAT WOULD MOVE THE NEEDLE MOST

+8 PTS TO UCL MATCH
Take the SAT Math II subject test
Two ISO applicants who added it last year moved from waitlist to admit. Next sitting: 7 Sep.

+5 PTS TO NYUAD MATCH
Lead a community / volunteering project
NYUAD weights leadership unusually heavily. Manhaj sees you have a PTA "events" link — could you formalise a lead role?

+3 PTS TO ALL UK UNIS
Finish personal-statement draft 4
Ms. Hala's draft 3 feedback is waiting. Her revisions historically raise predicted match by 3–6%.

ANONYMISED PAST STUDENTS WITH SIMILAR PROFILES

CLASS	IB	SAT	PROFILE NOTE	OUTCOME
2024 leaver A	44	1520	Same CS focus · led robotics club	UCL ✓ MCGILL ✓ NYUAD ✓
2024 leaver B	42	1450	CS + maths · part-time data work	UCL WAITLIST KING'S ✓ UOFT ✓
2025 leaver C	44	1500	CS + maths · IB diploma + EE in CS	MCGILL ✓ UOFT ✓ UCL ✕ (DECLINED OFFER)
2025 leaver D	41	1430	CS focus · weaker activities	UCL ✕ KING'S ✓ AUS ✓

About these numbers: Manhaj's internal model is trained on ISO's last 3 years of applicant outcomes (52 senior leavers). Match scores are **indication only — universities make the final call**, and many things outside our data (interview chemistry, university priorities that year, optional extras) matter too. Use this as a planning aid, not a verdict.

University Application Tracker

Senior students' application management with per-university match scores, cohort-relative positioning, and anonymised reference cases from past leavers — built on the school's own outcome data.

Visual summary · Backend & data · The mockup

Open mockup full-screen ↗

1 · VISUAL SUMMARY

What this screen is

Senior students' application management with per-university match scores, cohort-relative positioning, and anonymised reference cases from past leavers — built on the school's own outcome data.

WHO IT'S FOR

Year 10 to Year 12 students applying to university.

WORKFLOW IT SUPPORTS

Replaces spreadsheet + email tracking with one structured view. Match scores anchored in real outcomes from the school's last 3 cohorts.

KEY FEATURES

- Pipeline strip (Researching → In Progress → Submitted → Interview → Admitted / Rejected)
- Counsellor connection band (Ms. Hala always one click away)
- Per-university cards with status, fit tag (Safety / Target / Reach), match score, deadline, document progress
- Match score per university with cohort percentile ("top 25%")
- Placement insights panel: position-vs-cohort, base rates from school history, what would move the needle most, anonymised past students table
- Right rail: master docs checklist, test scores tracker, AI assistant (essay review, interview prep)
- Strict caveats: "Indication only, universities make the final call"

2 · BACKEND & DATA

What it takes to build this for real

Data inputs, backend services, AI role, and privacy considerations.

INPUT DATA REQUIRED

- Student's applications (per-university stage, documents, deadlines)
- Predicted IB grades + actual standardised test scores
- Personal statement drafts
- References from teachers + counsellor
- School's historical leaver outcomes (last 3+ years, anonymised)
- Per-university acceptance criteria (publicly published)

BACKEND BUILD REQUIRED

- applications table per student per university
- Historical-outcomes table (anonymised, used to train match model)
- Match model: starts as weighted regression on (predicted IB + SAT + profile strength + base rate), evolves with more data
- Anonymisation pipeline for the comparable-students table
- Strict role gating: student sees own; counsellor sees cohort; admin sees aggregated trends only
- School must commit to backfilling 2–3 years of historical outcomes during onboarding for the model to work

AI ROLE

Heavy: match scoring, qualitative essay feedback (with counsellor review), interview practice, university comparison.

PRIVACY & ACCESS

Strictest: student-private. Counsellor sees cohort. No student sees another student's score.

3 · THE MOCKUP

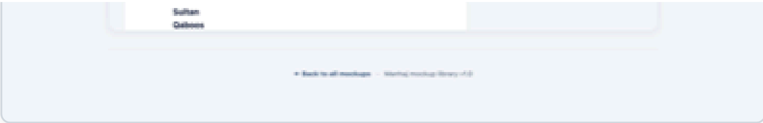
HA **Ms. Hala Al-Amri**
University & careers · Y11–12

Book a 1:1 session

Next available: **Mon 2 Jun · 2:00 PM**



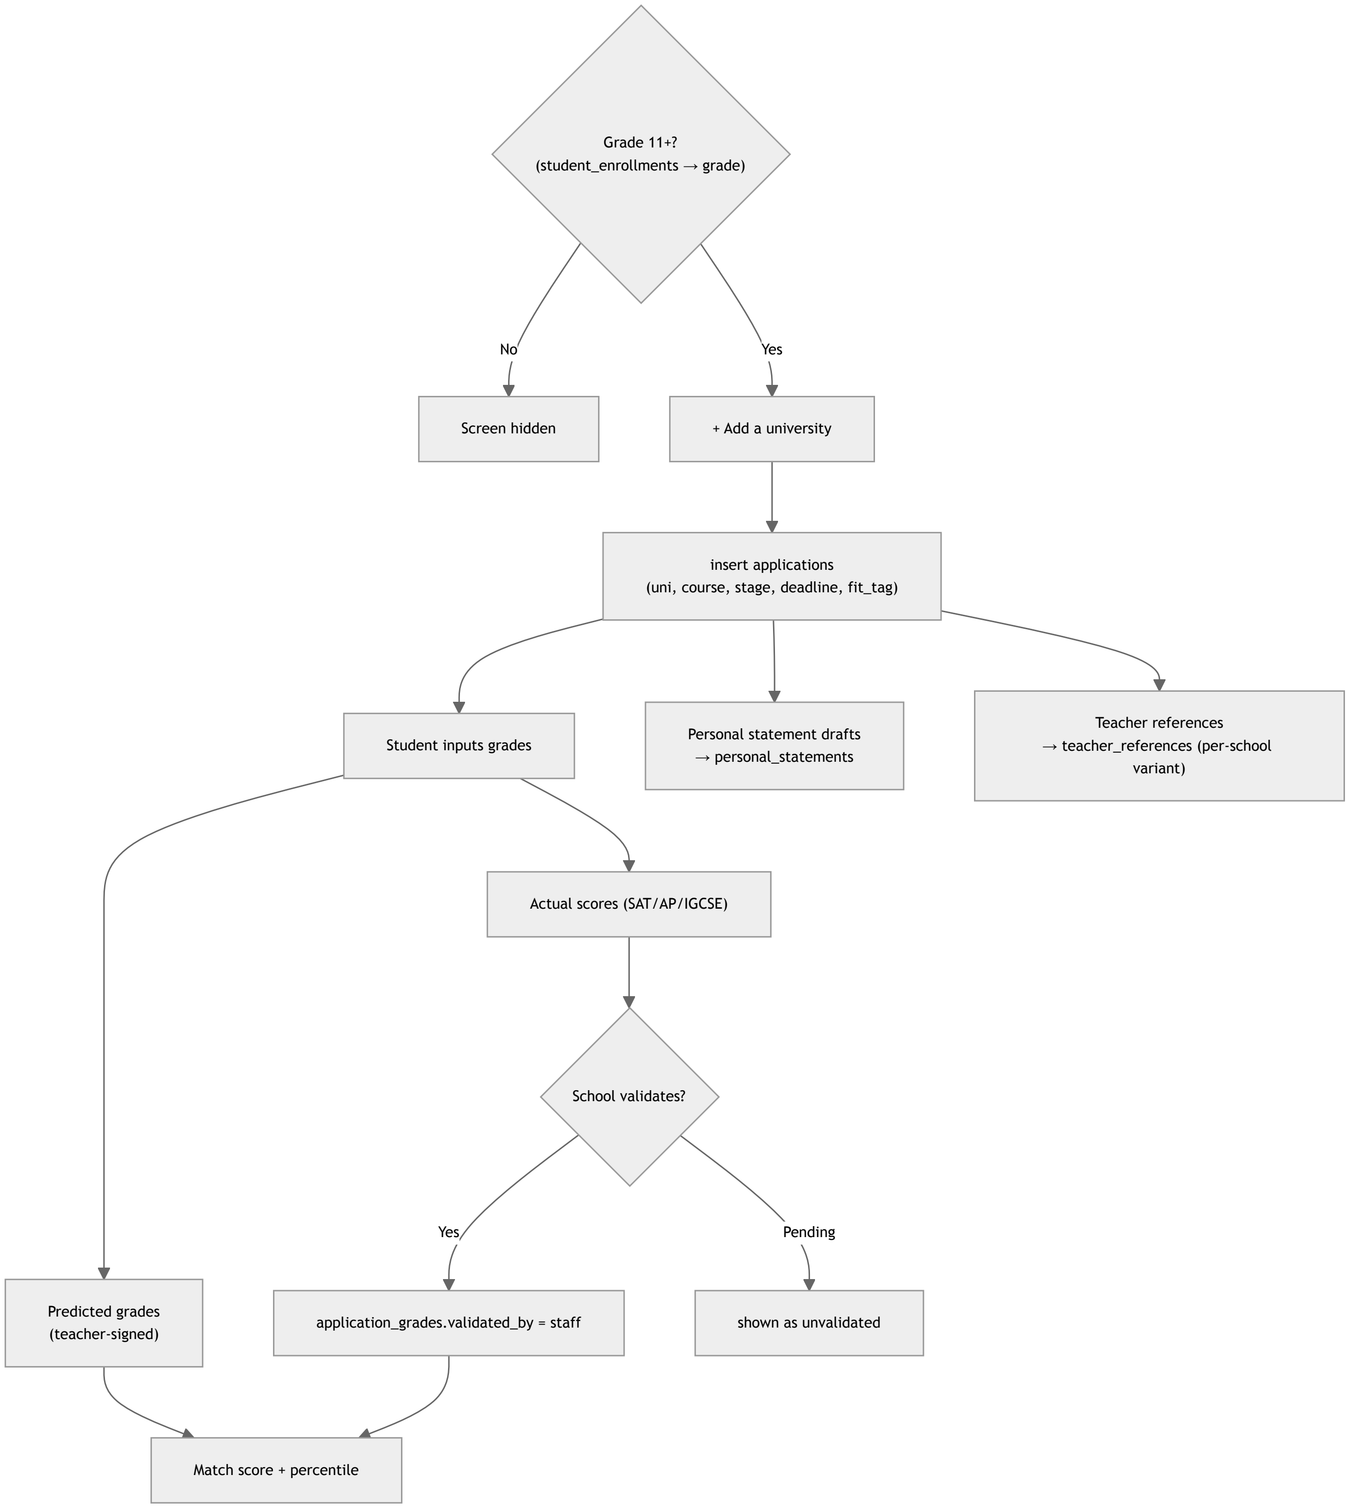
Who uses it & permissions.

- **Student** — inputs their own universities/applications, uploads their own grades and personal-statement drafts, sees only their own placement insights.
- **School (counsellor/admin/teacher)** — **validates** actual test scores (SAT/AP/IGCSE) so they become trusted; teachers **author references** (and adapt them per school); the counsellor reviews personal statements before any AI feedback is shared.
- **Strict gating** — student sees own only; counsellor sees the cohort; admin sees aggregated trends only. No student ever sees another student's score.

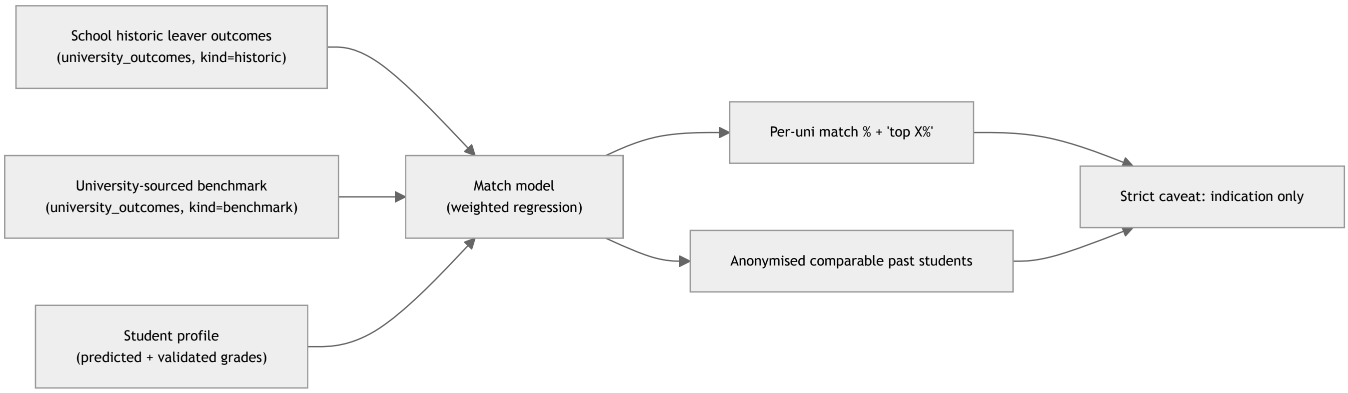
> Note: the university-guidance "counsellor" here may be the same person the **Admin** doc calls the at-risk "advisor" (`students.advisor_id`) — one role, two screen-specific labels.

- **Grade gate** — the whole screen is **gated to Grade 11+ (or Grade 10+)** via `student_enrollments` → section grade level (see open question on the exact cutoff).

Workflow (a) student adds + drives an application.



Workflow (b) placement insights — historic vs sourced benchmark.



Backend & data linkage (step by step).

1. **Gate** — render only if the student's `student_enrollments` resolves to a section `grade_level` ≥ the configured cutoff (11, possibly 10).
2. **Applications** — "+ Add a university" writes **`applications`** (NEW: student, university name/country, course, `stage`, `fit_tag` safety/target/reach, deadline, docs-progress). The pipeline strip and each card render straight off this table.
3. **Grades** — **`application_grades`** (NEW) holds both **predicted** (teacher-signed, e.g. predicted IB 43) and **actual** scores (SAT 1480, AP, IGCSE). The critical column is **`validated_by`**: actual scores are *input by the student* but must be **validated by the school** before they count as trusted — this is the grade-validation flow that is part of the research/build task in §Z. Predicted grades come from the teacher sign-off documented in the Teacher doc.
4. **Personal statements** — drafts stored in **`personal_statements`** (NEW: student, version, body, status). The counsellor reviews before any AI feedback surfaces ("draft 3 · awaiting Ms. Hala feedback").
5. **Teacher references** — **`teacher_references`** (NEW) stores a base reference per teacher, with the ability to **adapt per school**: a `base_reference_id` + per-application override (`application_id`, `adapted_body`). One academic + one personal reference in the mock; each can be tailored to a specific university's emphasis.
6. **Placement insights** — **`university_outcomes`** (NEW) holds two kinds of rows: `kind='historic'` (the school's last 3 years of leaver outcomes — the "52 senior leavers / base rates" data) and `kind='benchmark'` (data **sourced from the universities themselves** — what accepted students looked like, where they came from). The **match model** (starts as a weighted regression on predicted+actual grades + profile strength + base rate) combines profile + historic + benchmark to produce per-uni match % and the "top 18%" percentile. The anonymised comparable-students table is produced by an anonymisation pass over historic outcomes. Heavy AI here (match scoring, essay feedback, interview practice) — all logged to `ai_usage_ledger`; essay feedback is always counsellor-gated.
7. Strict RLS: student↔own, counsellor↔cohort, admin↔aggregate. Every action → `audit_log`.

Front-end ↔ table mapping.

On-screen element	Source
Pipeline counts (Researching…Admitted)	`applications.stage` (group/count)
Uni card (name, course, fit tag, deadline, docs %)	`applications`
Match score + "top 25%"	match model over `university_outcomes` + `application_grades`
Test-scores rail (IELTS 8.0, SAT 1480)	`application_grades` (kind=actual, validated)
Predicted IB 43 (signed off)	`application_grades` (kind=predicted, `validated_by` =teacher)
Master-docs: personal statement draft 3	`personal_statements`
Reference letters (academic / personal)	`teacher_references`
"3-year ISO base rates" + comparable-students table	`university_outcomes` (kind=historic, anonymised)
"What would move the needle"	match model deltas (AI)

Data tables (mock — student Yara Khalfan, Y12; cohort = ISO).

uo5	—	benchmark	NYUAD	CS	2025	—	—	~4% (overall)	**university-sourced (RESEARCH)**

> The `benchmark` rows (uo4/uo5) are the **key data-sourcing task** — what accepted students looked like and where they came from, sourced from the universities themselves, to compare against the school's own historic base rates. Assigned in §Z.

Deferred to P2/P3. None deferred — but flagged as the heaviest P1 build. The match model is intended to *start simple* (weighted regression on the historic backfill) and improve as more cohorts accrue; this is a build-approach note, not a deferral.

Open questions (this screen has the most).

- **Grade gate cutoff** — Grade 11+ or Grade 10+? (Mockup says "Year 10 to Year 12"; pipeline copy says Y12.) Founder to confirm.
- **Grade-validation flow** — who at the school validates SAT/AP/IGCSE (counsellor, exams officer, admin), and what's the evidence requirement (upload of official report vs manual attest)? **RESEARCH TASK** — §Z.
- **University benchmark data** — where is it sourced (university websites, UCAS/Common Data Set, paid datasets), how often refreshed, and what licensing applies? **RESEARCH TASK** — §Z.
- **Historic backfill** — the school must commit to backfilling 2–3 years of leaver outcomes at onboarding for the model to work at all. Who owns that, and what minimum N makes the match score honest?
- **Match-model honesty** — with only ~52 leavers, how do we caveat / suppress scores when the sample is too thin?
- **Reference adaptation** — does an adapted reference need re-approval by the authoring teacher each time it's tailored per school?

- **AI essay feedback** — strictly counsellor-gated (current assumption) or can low-risk grammar feedback go direct to the student?

Z. Build & data handover

Task allocation

Build item	Owner role	Why
`student_goals` + `goal_checkins` + `goal_reflections` tables, read-time progress resolver	**Engineer**	Core S1 write-path + the computed-progress logic (progress never stored).
Goal AI-suggestion call (rubric weak-axis → 1–2 goals)	**Engineer** + **Hybrid CTO** (cost)	Only AI in S1; CTO sizes the per-call cost/cap against `ai_usage_ledger` .
Teacher/counsellor goal-set surface (writes same `student_goals`)	**Engineer** (cross-links to Teacher doc)	Same table from the teacher side; must not fork the schema.
S2 week-aggregation + suggested-block engine (recompute per selected week)	**Engineer**	Reads timetable/assessments; the per-week recompute is a stated founder requirement.
S2 drag-to-adjust UI + `study_blocks` persistence	**Engineer**	Founder-liked interaction; persist only the edited overlay.
`applications` / `application_grades` / `personal_statements` / `teacher_references` / `university_outcomes` tables	**Engineer**	The heavy S3 data model.
University match model (weighted regression → evolve)	**Hybrid CTO** + **Engineer**	Model design + AI cost; engineer wires it.
Grade-validation flow (who validates SAT/AP/IGCSE; evidence rule)	**Hybrid CTO** (scoping) + **Sales** (school-side) + **Engineer** (build)	RESEARCH TASK — needs school process definition before build.
University benchmark data sourcing	**Sales** (school access + outreach) + **Hybrid CTO** (licensing/feasibility)	RESEARCH TASK — the key data-to-source row below.
Historic leaver-outcome backfill (2–3 yrs)	**Sales** (gathers from school) + **Engineer** (ingest + anonymise)	Match model is useless without it; school must commit at onboarding.
RLS gating (student/counsellor/admin tiers) across S1–S3	**Engineer**	Strict privacy is a hard requirement, especially S3.

Data to source from the school

Table / dataset	Fields needed	Source (who/where)	Why it's needed / what it feeds
`university_outcomes` (kind= `historic`)	university, course, cohort_year, #applicants, #admits, anonymised profile notes	**School leaver records** — registrar / counsellor archive (Sales gathers)	Base rates + comparable-student cases in S3 placement panel; trains the match model.
`university_outcomes` (kind= `benchmark`)	per-uni overall admit rate, accepted-student profile (grades range), where admits came from	**Universities themselves** — official sites, Common Data Set / UCAS, possibly paid datasets (**RESEARCH TASK** — Sales + Hybrid CTO)	The comparison benchmark against the school's own history; the single most important sourcing row.
`application_grades` validation rule	who validates, evidence type (official report upload vs attest)	**School exams/counselling process** (Sales + Hybrid CTO define)	Makes actual SAT/AP/IGCSE scores trusted; gates match scoring.
Predicted grades	predicted IB/A-level per student, teacher sign-off	**Teachers** (see Teacher doc)	Feeds match model + the docs rail; the "signed off" trust marker.
Grade-gate config	grade-level cutoff (10 vs 11)	**Founder / school**	Gates whether S3 renders for a student.
Rubric scores (existing)	6-axis monthly scores	**Teachers** (`rubric_scores`)	Drives S1 AI goal suggestions + S2 weak-area study targeting.
Timetable + assessments (existing)	`timetable_slots` , `assessments` (test/homework)	**Admin** (timetable) + **Teachers** (assessments)	The entire read-side of S2.

End of Student Phase-1 handover. Practice Quizzes (P2, paired with Teacher T4) and the scrapped Well-being check-in are intentionally not given full sections — see §0 phasing snapshot. When the P2/P3 docs are drafted, output the clean-linkage notes flagged in §1–§2 for any feature built separately.
