

Manhaj Parent — Phase 1 Workflow Handover

Phase: Phase 1 (build now). Companion to `docs/handover_phase1_teacher.md` (the teacher screens that *write* most of what the parent *reads*), `docs/admin_v1_build_handover.md` (architecture, auth, the cadence setting that drives P1), and governed by `docs/handover-assets/_SHARED_SPEC.md`. **Who it's for:** anyone picking up the parent build — the engineer wiring it, the hybrid CTO sizing the AI cost on the digest, or the (non-technical) sales lead validating workflows and sourcing the school's payment / health / trip data. **How to read this:** §0 is the orientation (who the parent is, the screen-at-a-glance table, what's deferred and why). §1–§4 are one section per Phase-1 screen — plain-English description, embedded screenshot, a Mermaid workflow, the backend/data linkage, and mock data tables. §Z is the build & data handover.

Diagrams are **Mermaid** — they render as pictures on GitHub and in our PDF build. Parents use the **web app** in Phase 1 (a phone-friendly web app opened in the browser) plus **email** (Resend). A native mobile app is a later phase. **Comms are email-only** — never "WhatsApp" in parent-facing copy.

0. Archetype summary

The Manhaj parent is a **consumer** of data, not a producer of it. Almost everything a parent sees was written by a teacher (attendance, rubric, grades, recognition), an admin (cadence, trips, invoices), or the school's own systems (fees). Phase 1 gives the parent four read-or-confirm surfaces: a **weekly digest** that summarises each child's week, a **permission slip** to consent to trips, an **invoice** that shows what is owed and how to pay it by bank transfer, and a **sibling comparison** that stacks all their children side by side. The parent's only real *writes* in Phase 1 are a consent signature (P4) and small profile confirmations (emergency contact, health-check answers). Two-way messaging, feedback / raise-an-issue, and PTA volunteering are all **deferred** — the Phase-1 parent reads, signs, and pays.

The running example family throughout this doc is **Mr Al-Habsi**, a parent of three: **Layla (Grade 10)**, **Omar (Grade 7)**, and **Yasmin (Grade 3)**. School is the International School of Oman; amounts are in **AED**.

Parent screen-code legend. The parent screens are numbered **P1** weekly-digest · **P4** permission-slip · **P5** invoice/payment · **P6** sibling-comparison. The numbering skips because **P2 (inbox)**, **P3 (direct-teacher-message)**, **P7 (PTA-volunteer)**, **P8 (activity-signup)**, and **P9 (pickup/raise-issue)** are **DEFERRED** — they have **no sections in this Phase-1 doc**. Sections below run in code order P1 → P4 → P5 → P6.

Phase-1 screens at a glance

Screen	Purpose	Key data it READS	Key data it WRITES	Links to
P1 · Weekly digest	Per-child weekly summary (default cadence WEEKLY, admin-set) + "things to do"	<code>attendance_marks</code> , <code>assessment_results</code> , <code>behaviour_notes</code> , <code>rubric_scores</code> , upcoming events, open <code>permission_slips</code> / <code>invoices</code>	<code>comm_drafts</code> (the sent digest), <code>audit_log</code>	Teacher attendance (T1), rubric (T2), class summary (T3); P4 sign, P5 pay
P4 · Permission slip	Trip/activity consent, driven by a top dropdown that selects the activity	NEW <code>activities</code> , NEW <code>student_health</code> , <code>students</code> , <code>parents</code> , <code>student_parents</code>	NEW <code>permission_slips</code> , <code>consent_records</code> , NEW <code>student_health</code> (updates)	Teacher trip summary, P1 "things to do", Admin safeguarding (declines)
P5 · Invoice / payment	Read-only "what is owed, for what, by when" + bank details + reference code (NO gateway in P1)	NEW <code>invoices</code> , NEW <code>invoice_lines</code> , school bank details (config), <code>students</code> , <code>parents</code>	nothing in P1 (status comes from the school's file)	P1 "things to do", Admin fee-delinquency (A5)
P6 · Sibling comparison	One household view: all children's attendance / grades / rubric / actions side by side	<code>student_parents</code> , <code>attendance_marks</code> , <code>assessment_results</code> , <code>rubric_scores</code> , per-child open actions	nothing (read-only)	P1 digest (per child), P4 sign, P5 pay

Phasing snapshot

Item	Phase	Why (one line)
P1 Weekly digest (in-app + email)	Phase 1	Headline feature; reads already-entered teacher/admin data.
P1 cadence setting (weekly default)	Phase 1	Admin chooses WEEKLY (preferred) or monthly; one setting drives the cron.
P1 color-coded "needs attention" next-week items	Phase 1	Parents must see at a glance what requires their action.
P4 Permission slip + activity dropdown	Phase 1	Replaces lost paper slips; standardised input → standardised output.
P4 Student health-check (student_health)	Phase 1	New table; allergies/meds/emergency contact feed the trip teacher's summary.
P5 Invoice (minimal: owed / for-what / due / status)	Phase 1	Founder: heavy billing backend is overkill — store the minimum.
P5 Bank details + per-family reference code	Phase 1	No gateway in P1; parents pay by bank transfer using a reference code.
P6 Sibling comparison	Phase 1	Founder happy, no comments; pure read across student_parents .
P5 payment-gateway / portal redirect	Phase 2	Card/portal pay deferred; P1 shows bank transfer only.
Feedback / raise-an-issue	Deferred	The "feedback" surface referenced by P1 lives in its OWN visual, not the digest.
Parent inbox / messages	Phase 3	Threaded parent messaging; demo-docs only in P1.
Direct-teacher message	Phase 2/3	Teacher↔parent chat; Gmail-vs-portal reply path still open.
PTA volunteer	Phase 3	Low-frequency; demo PDF only.
Activity / extra-curricular sign-up	Phase 2	Beyond trip consent; also consider letting students sign up, not just parents.

1. P1 — Weekly digest (parent dashboard)

What it is. The parent's home screen and the product's headline feature. Once per cadence period (default **WEEKLY**, chosen by the admin — weekly is preferred over monthly) each family gets a per-child summary: an AI-drafted narrative paragraph, quick stats (attendance, homework, top grade, behaviour notes), a timeline of what happened, a **color-coded "coming up next week"** strip, teacher recognition quotes, and a **"things you need to do"** action list (sign a consent, view an invoice). It is delivered both **in-app** and as an **email via Resend**. It reads data that teachers and admins have *already entered* — the parent never types here. **This screen does NOT contain a feedback section** — giving feedback / raising an issue is a separate, deferred visual (see §0 phasing).

Visual.

WEEKLY DIGEST · SUN 24 — THU 28 MAY

Layla had a strong week.

A short summary of how Layla is doing, drafted from this week's classroom data.

Layla had her best maths week of the term, scoring 92% on Tuesday's quiz — her highest yet. She was also recognised by Ms. Sara for confident reading aloud in Arabic on Wednesday, and was noticed helping a new classmate at Thursday lunch. One homework missed on Monday — otherwise full attendance and on top of everything. Looking ahead, the Bait Al Zubair field trip on Wednesday needs your signed consent by Tuesday.

• Drafted by Manhaj AI · reviewed by Ms. Sara before sending

[Visual summary](#) [Backend & data](#) [The mockup](#) [Open mockup full-screen](#)

An AI-drafted weekly summary email and in-app screen showing each child's week – what happened, what's coming up, and what needs the parent's response.

Every parent, every week — auto-delivered Thursday afternoon.

The headline product feature, reduces "I never know what's going on at school" complaints, drives parent engagement, gives parents the right amount of information at the right time without overwhelming them.

- AI-generated narrative paragraph in the school's voice (Tariq style or Sara style, learnt over time)
- Quick stats: attendance %, homework completion, top grade, behaviour notes
- Timeline of what happened this week (5 highlights, day-by-day)
- Coming up next week strip with the most important items flagged
- Recognition quotes verbatim from teachers
- "Things you need to do" action items (sign consent, view invoice, etc.) with one-click CTAs

Data inputs, backend services, AI role, and privacy considerations.

- Daily attendance roll-call data (see *Appendix*, per period)
- Assessment scores submitted by teachers (this week)
- Behaviour notes → positive recognitions + any incidents
- Homework completion records from the homework portal
- Upcoming calendar events (next week)
- Recognition entries logged by individual teachers across subjects
- Open action items per family (unsigned consent forms, due fee instalments, pending decisions)

- Scheduled background job (Trigger now or cron) that runs weekly per family
- Claude Sonnet API for narrative drafting, with 2-layer prompt caching for cost control (~80-90 per digest)
- Email delivery via Resend (or school's existing transactional provider)
- Dual rendering: HTML email + in-app web view from the same content payload
- Audit log of generated digests (which families, what content, when sent, delivery status)
- Optional teacher pre-review queue if the school wants to approve before send (Friday morning)

Heavy: AI generates the entire narrative from structured data inputs, learns the school's tone over time, selectively highlights what matters most for that specific child.

Per-family isolation enforced via Supabase Row-Level Security. No cross-family data leakage. Optionally shared with extended family (grandparents) if parent opts in.

Embedded below — or open full-screen ↗ to interact with it directly.

Work up to the parent's weekly digest link.

Who uses it & permissions. Every parent, for their own children only (RLS scopes the digest to students linked via `student_parents`). No cross-family leakage. Optionally shared with extended family (grandparents) if the parent opts in — deferred. Teachers/admins do not consume this screen; they produce its inputs.

Workflow.

Backend & data linkage.

- **Cadence & trigger.** A scheduled background job (Trigger.dev / cron) runs **per family per cadence period**. The cadence is an **admin setting** (default WEEKLY ; the alternative is monthly — weekly is preferred). One setting drives one cron; the same gather/draft/send pipeline runs regardless of cadence.
- **Gather (read-only).** Per child the job reads: `attendance_marks` (the week's roll-call — sourced either from **manual input / daily upload OR a teacher via the T1 attendance screen**), `assessment_results` for grades, homework-kind `assessments` for completion %, `behaviour_notes` for recognition/incidents, `rubric_scores` where relevant, upcoming calendar events, and open action items (unsigned `permission_slips`, due `invoices`).
- **The quick-stat cards map 1:1 to reads:** "Attendance 100%" = the week's `attendance_marks` for that student; "Homework 89%" = homework `assessments` completion; "Top grade 92%" = max `assessment_results.score` this week; "Behaviour +2" = count of positive `behaviour_notes`.
- **AI draft.** One Claude call per child turns the structured inputs into the narrative paragraph in the school's voice; one `ai_usage_ledger` row (`request_kind='parent_digest'`). The sent digest persists as a `comm_drafts` row (template-driven, consent-gated via `consent_records`) with `sent_via='email'`, `sent_message_id` from Resend.
- **Email-only delivery.** The weekly digest is delivered **by email (Resend)** only; email-only is **enforced in app logic** (the `comm_channel` enum still includes other values at the schema level, but Phase-1 parent comms never use them).
- **Color-coding (a P1 requirement).** Every "coming up next week" item that **requires parent attention** is color-coded — e.g. a consent **due** chip in warning amber, a fee installment in caution yellow, a field trip in event purple. Informational items ("normal schedule") stay muted. This is front-end styling driven by the item's `action_required` flag + type, not a new table.
- **"Link when completed" (OPEN).** When a parent acts on a "things to do" item (signs P4, pays P5), that item must be **marked done and linked back** so it disappears from the next digest. The clean mechanic is: each action item is a reference to a real row (`permission_slips.id` / `invoices.id`); the digest renderer reads that row's `status` at render time, so a signed/paid row simply drops out. The **resolved open question** below is whether we also push an immediate in-app update vs waiting for the next render.
- **Downstream / upstream.** Upstream producers are Teacher T1 (attendance), T2 (rubric), T3 (class summary), and admin (events, invoices, trips). Downstream the digest is the entry point to P4 (sign) and P5 (pay), and the per-child cards are reused in P6 (sibling

comparison).

Data tables.

`comm_drafts` (existing) — the sent weekly digest for one child:

template (code)	student	parent	slot_values (excerpt)	status	sent_via	sent_at
weekly_digest	Layla Al-Habsi (G10)	Mr Al-Habsi	{week:"24–28 May", top_grade:"92%", attendance:"100%"}	sent	email	2026-05-28 15:10
weekly_digest	Omar Al-Habsi (G7)	Mr Al-Habsi	{week:"24–28 May", attendance:"80%", note:"1 absence"}	sent	email	2026-05-28 15:10
weekly_digest	Yasmin Al-Habsi (G3)	Mr Al-Habsi	{week:"24–28 May", highlight:"read aloud unaided"}	sent	email	2026-05-28 15:10

Read-only inputs surfaced as cards (existing tables) — Layla, week of 24–28 May:

card	source table	sample value
Attendance	<code>attendance_marks</code>	100% · 5 of 5 days
Homework done	<code>assessments</code> (homework) + results	89% · 1 missed Monday
Top grade	<code>assessment_results</code>	92% · Maths · Tue quiz
Behaviour notes	<code>behaviour_notes</code>	+2 positive · 0 incidents

`ai_usage_ledger` (existing) — one row per child digest draft:

request_kind	model	input_tokens	output_tokens	cost_usd	is_background
parent_digest	claude-sonnet-4-6	2,400	380	0.0104	true

Deferred to P2/P3. Feedback / raise-an-issue is **NOT** on this screen — it is a separate, deferred visual (see \$0). Extended-family (grandparent) sharing is deferred. The optional teacher **pre-review queue** is a P1-optional toggle, not a blocker.

Open questions.

- **Source of behaviour-incident & recognition input.** The digest shows both, but the *system-of-record* for a "recognition" (a positive `behaviour_notes` ? a teacher recognition entry? a rubric note?) needs confirming so the timeline pulls from one place, not three. Sales to confirm how teachers log recognitions today.
- **Email-resend build process.** Confirm the Resend send + the in-app render share **one** content payload (build once, render twice), and define retry/bounce handling and the optional Friday pre-review send window.
- **"Link when completed" mechanic.** Confirm action items are row-references (so a signed slip / paid invoice auto-drops at next render) and decide whether an immediate in-app mark-done is needed vs next-render only.
- Attendance source per school — manual daily upload vs teacher T1 entry (or both); affects how fresh the digest is at send time.

2. P4 — Permission slip / activity & trip

What it is. A digital consent form that replaces paper slips lost in school bags. The defining P1 requirement: a **dropdown at the TOP that first SELECTS the activity** (e.g. "Bait Al Zubair Museum · 3 June"), and that selection **drives the rest of the form** — trip context (date, transport, cost, supervision, curriculum link, risk-assessment PDF) is pulled from the chosen activity's record. By **standardising the input per trip**, the **output is standardised** too: every signed slip for a trip has the same shape, so the trip teacher gets one clean roster. The form also captures / confirms a **student health-check** (allergies, conditions, medications, emergency contact, consents) and a typed-name signature. A **summary is shown at the top for the teacher who conducts the trip** — the consolidated who's-coming + who-to-watch view.

Permission Slip

A digital field-trip / activity consent form with all the school's pre-populated content (trip details, supervision, cost, curriculum link) plus health and emergency contact fields the parent confirms or updates.

[Visual summary](#)
[Backend & data](#)
[The mockup](#)
[Open mockup full-screen](#)

1 - VISUAL SUMMARY

What this screen is

A digital field-trip / activity consent form with all the school's pre-populated content (trip details, supervision, cost, curriculum link) plus health and emergency contact fields the parent confirms or updates.

WHO IT'S FOR

Parents responding to a consent request from the school – average ~5-8 per year per child for trips and activities.

WORKFLOW IT SUPPORTS

Replaces paper forms that get lost in school bags. Tracked, audit-logged, parents get a signed PDF back.

KEY FEATURES

- Trip context (aptid: dates, times, transport, cost, supervision-rafts, curriculum link, risk assessment PDF)
- Pre-filled emergency contact from family profile (editable per trip)
- Health declaration with conditional fields (no changes / you described)
- Discrete permission checkboxes (attend + bus, emergency medical, photography)
- Typed-name digital signature with date stamp
- Sticky footer with Decline / Save draft / Sign and submit actions
- Auto-save during completion

2 - BACKEND & DATA

What it takes to build this for real

Data inputs, backend services, AI role, and privacy considerations.

INPUT DATA REQUIRED

- Trip details (date, location, cost, supervisor) – entered by the trip organiser teacher
- Family profile (parent name, contacts, child DOB)
- Child's medical record (allergies, conditions, medications) for the health declaration check
- Risk assessment document (uploaded by H&S officer)
- Signature audit trail

BACKEND BUILD REQUIRED

- Trip records with associated consent form template
- Per (family, trip) consent record with status: not started / draft / signed / declined
- Signed PDF generation on submit (PDF library or HTML-to-PDF service)
- Email confirmation with signed PDF attached
- Audit log: when signed, IP address, edits during completion
- Connection to safeguarding log if declined (flag for follow-up)

AI ROLE

None. Consent is a legal artifact and should feel deterministic.

PRIVACY & ACCESS

Per-trip per-family. Signed PDF stored long-term. Health declaration only visible to nurse + class teacher + trip leaders.

Who uses it & permissions. Parents respond for their own child (RLS via `student_parents`); ~5–8 slips per child per year. The **trip teacher** sees the per-trip summary (who's signed, declined, outstanding, plus health flags) for the activity they run. Health-check answers are visible to nurse + class teacher + trip leaders only. Declines route to the admin safeguarding log for follow-up.

Workflow.

Backend & data linkage.

- **Activity dropdown** → **form**. The top dropdown lists the school's open **NEW activities** rows for that child's section/grade. Selecting one drives every read-only context cell (depart/return, transport, cost, supervisor ratio, curriculum link, risk-assessment PDF) straight off the chosen **activities** row. Because the activity definition is standardised, every parent fills the **same** fields — so the output roster is standardised.
- **Per-student record**. Each parent response is one **NEW permission_slips** (aka an activity signup) row keyed **unique** (activity_id, student_id) with status (not_started / draft / signed / declined), signed_by_parent_id, signed_name, signed_at. The discrete checkboxes also write **consent_records** rows (consent_kind for emergency-care and photography) so consent is auditable in the compliance table.
- **Student health-check (NEW)**. The health declaration reads and (if changed) writes a **NEW student_health** row per student: allergies, conditions, medications, emergency_contact_name/phone/relationship, consent_emergency_care, updated_by_parent_id, updated_at. P4's "no changes from her file / yes — describe" maps directly to a read of this row and an optional update. This becomes the **system-of-record for allergies/medical** that the Teacher T6 substitute sheet flagged as an open question — built here, consumed there.
- **Teacher trip summary (top of screen, for the trip teacher)**. A read-side roll-up across **permission_slips** (signed / declined / outstanding counts) joined to **student_health** (allergy/medical flags) and **students** — the teacher conducting the trip gets one consolidated card: who's coming, who's outstanding, and who to watch.
- **PDF + email**. On sign, an HTML-to-PDF render produces the signed slip, stored on the student's record and emailed (Resend). Every step writes **audit_log** (signed-at, IP, edits during completion). **No AI** — consent is a deterministic legal artifact.
- **Link-back**. The P1 "sign field-trip consent" action item references **permission_slips.id**; once status='signed' it drops from the next digest.

Data tables.

NEW activities — standardised trip/activity definition (drives the form):

id	label	activity_date	section/grade	depart / return	transport	cost_aed	supervisor_ratio	curriculum_link	risk_pdf_path
ACT-228	Bait Al Zubair Museum	2026-06-03	G10 (History)	08:30 / 13:30	School bus	35	1:8	Oman heritage unit	storage://risk/act228.pdf
ACT-231	Science Centre visit	2026-06-11	G7 (Science)	09:00 / 14:00	School bus	40	1:8	Forces & motion	storage://risk/act231.pdf

NEW `permission_slips` — one row per student per activity:

activity_id	student	status	signed_by_parent	signed_name	signed_at
ACT-228	Layla Al-Habsi (G10)	signed	Mr Al-Habsi	Ahmed Al-Habsi	2026-05-30 19:42
ACT-231	Omar Al-Habsi (G7)	not_started	—	—	—

NEW `student_health` — one row per student (allergies/meds/emergency contact/consent):

student	allergies	conditions	medications	emergency_contact	emergency_phone	consent_emergency_care	updated_by_parent
Layla Al-Habsi (G10)	None on file	—	—	Ahmed Al-Habsi (Father)	+968 9876 5432	true	Mr Al-Habsi
Omar Al-Habsi (G7)	Peanuts	Mild asthma	Inhaler (as needed)	Ahmed Al-Habsi (Father)	+968 9876 5432	true	Mr Al-Habsi

`consent_records` (existing) — discrete per-trip consents:

student	consent_kind	granted	parent	granted_via
Layla Al-Habsi	data_processing (emergency-care)	true	Mr Al-Habsi	email_reply (typed signature)
Layla Al-Habsi	lecture_recording (photography)	false	Mr Al-Habsi	email_reply (typed signature)

Deferred to P2/P3. Broader **activity / extra-curricular sign-up** (clubs, electives, recurring activities beyond one-off trip consent) is **Phase 2** — and should **consider letting students sign up themselves**, not only parents (the `permission_slips` shape already supports a `signed_by_student` flag if added). Clean-linkage: build P2 sign-up on the same `activities` + `permission_slips` tables; only the actor and the lack of a legal signature differ.

Open questions.

- System-of-record for the **base** medical record vs the per-trip health-check: is `student_health` the master (recommended), or does the school hold a separate nurse register we sync from? Sales to source the school's existing medical-record format.
- Does a **decline** auto-create a safeguarding-log entry, or just a flag for admin review?

3. P5 — Invoice / payment

What it is. A **deliberately minimal** invoice screen. The founder is explicit: a heavy billing backend is **overkill** for Phase 1 — Manhaj is not a payment processor and should not try to be one. P1 stores only **what is owed, for what, the due date, and the payment status**. There is **no payment-gateway / portal redirect in P1** (that is Phase 2). Instead the screen **showcases the school's bank details** plus a **per-student / per-parent reference code** so the parent can pay by bank transfer and the school can reconcile it. The screen also shows an **invoice breakdown** (line items sourced from the school) and a read-only payment history. Payment data itself most likely arrives as a **file upload from the school**, which Manhaj transforms/maps into invoice + status rows.

Founder note (overrides the mockup): the live mockup `parent-invoice-payment.html` still shows a "Pay on ISO Parent Portal ↗" redirect panel. That **portal/gateway redirect is Phase 2**. In Phase 1, replace that right-hand panel with **bank details + reference code + "Download invoice PDF"**. Document and build the bank-transfer version; the screenshot's portal card is the P2 target, not the P1 build.

Term 3 - Installment 3

Term 3 fee — Installment 3 of 4

For Layla Al-Habsi - Grade 5B - Academic year 2025/26

AMOUNT DUE

AED 8,750.00

Invoice INV-2026-T3-03 - Issued 25 May 2026

DUE

15 June 2026

16 days from today

What this covers

Term 3 runs from 30 March to 27 June 2026.

Tuition (Term 3 portion)

Grade 5 - 13 weeks

AED 6,500.00

Bus transport

Route B - home-school return

AED 850.00

Lunch programme

Hot lunch - 5 days/week

AED 600.00

Enrichment & field trips

Includes Balt Al Zubair - 3 June

AED 450.00

Books & stationery deposit

Refundable at year end

AED 350.00

Total due

AED 8,750.00

Payment history

Everything you've paid this academic year.

INVOICE	DESCRIPTION	PAID	METHOD	STATUS	AMOUNT

15. 1997年12月1日, 某公司因故被宣告破产, 清算组接管该公司财产, 发现下列情况:

Invoice details with breakdown, payment history, and a deep-link to the school's own payment portal — Marhaaj does not process payments itself.

Invoice details with breakdown, payment history, and a deep-link to the school's own payment portal — Marhaaj does not process payments itself.

WWW.IT'S.FOR

Parents viewing fees, checking what they owe, and downloading receipts.

WORKFLOW IT SUPPORTS

Visibility into financial relationship without taking on PCI compliance or transactional liability. Parent sees the data, school's existing payment provider handles the money.

KEY FEATURES

- Hero balance card with amount due and deadline countdown
- Itemised "What this covers" breakdown (tuition, transport, lunch, books, etc.)
- Full payment history with downloadable receipts
- Right panel: redirect to school's payment portal (Net / Tel / Pay/Payee / etc.) with portal branding
- Clear external link indication on the Pay button
- "What happens next" expectation setting (typic delay 7-5 min)
- No payment method picker — handled in the school's portal

注: ① 数据来源于《中国统计年鉴》; ② 数据来源于《中国统计年鉴》。

Data inputs, backend services, AI role, and privacy considerations.

INPUT DATA REQUIRED

- Invoice records from the school's billing system (one-way sync)
- Payment status updates from the school's payment processor (webhook or polling)
- Receipt PDFs from the processor
- School's payment portal URL (per-school configuration)

[illegible]

- Read-only sync from school's billing system (PowerSchool finance, custom, etc.)
- Webhook receiver for payment status changes (or polling fallback)
- Per-family invoice + payment ledger view
- Receipt PDF storage (Supabase Storage)
- No PCI compliance burden — Marsha never sees card data

and 1998).

None. Financial actions should feel deterministic.

PERSONA & ADDRESS

Per-family, Read-only from our side, we never write financial transactions back.

Payment history

Everything you've paid this academic year.

INVOICE	DESCRIPTION	PAID	METHOD	STATUS	AMOUNT
000-2026-T3-02	Term 3 - Installment 2	16 Mar 2026	Visa **** ****	Paid	AED Receipt 8,750 +
000-2026-T3-01	Term 3 - Installment 1	16 Dec 2025	Bank transfer	Paid	AED Receipt 8,750 +
000-2026-T3-04	Term 2 - Installment 4 (final)	16 Sep 2025	Visa **** ****	Paid	AED Receipt 8,000 +
000-2025-REG	Registration & books	5 Aug 2025	Bank transfer	Paid	AED Receipt 2,400 +

Who uses it & permissions. Parents, for their own children only (RLS via `student_parents`). Read-only from Manhaj's side — we never write a financial transaction back to the school. Status changes flow **in** from the school's file, never out from us.

Workflow.

Backend & data linkage.

- **Ingest (file → rows).** The school exports fee data; Manhaj transforms/maps it into **NEW invoices** (one per student per installment) and **NEW invoice_lines** (the breakdown). This is a **one-way, read-only** sync — Manhaj is a display layer over the school's billing truth, deliberately thin.
- **invoices (NEW)** holds the minimum the founder specified: `student_id` , `parent_id` , `label / what_for` , `amount_owed_aed` , `due_date` , `status` (`unpaid / paid / overdue / partial`) , `invoice_no` , `issued_on` , plus the per-family `reference_code` shown for bank transfer. **invoice_lines (NEW)** holds the breakdown (`invoices.id` , `description` , `amount_aed`) — sourced from the school.
- **Bank details + reference code (display-only, P1's pay mechanic).** Instead of a gateway, the right panel shows the **school's bank details** (held as per-school config, not a table the parent writes) and a **reference code** unique per student/parent (e.g. `ISO-ALHABSI-L10`) so the school can reconcile an incoming transfer to the right family/invoice. This replaces the mockup's portal-redirect card for P1.
- **Status.** Because P1 has no gateway webhook, **status is whatever the school's latest file says** — the parent's transfer is reconciled by the school, who re-uploads, and Manhaj re-maps `status='paid'` . No PCI burden; Manhaj never sees card data.
- **Link-back.** The P1 "Term fee installment" action item references `invoices.id` ; once `status='paid'` it drops from the next digest. The same rows feed the Admin **fee-delinquency** dashboard (A5).

Data tables.

NEW invoices — minimal, one row per student per installment:

invoice_no	student	parent	what_for	amount_owed_aed	due_date	status	reference_code
INV-2026-T3-03	Layla Al-Habsi (G10)	Mr Al-Habsi	Term 3 · Installment 3 of 4	8,750.00	2026-06-15	unpaid	ISO-ALHABSI-L10
INV-2026-T3-03	Omar Al-Habsi (G7)	Mr Al-Habsi	Term 3 · Installment 3 of 4	8,250.00	2026-06-15	unpaid	ISO-ALHABSI-O07
INV-2026-T3-02	Layla Al-Habsi (G10)	Mr Al-Habsi	Term 3 · Installment 2 of 4	8,750.00	2026-03-15	paid	ISO-ALHABSI-L10

NEW invoice_lines — breakdown sourced from the school (INV-2026-T3-03, Layla):

description	amount_aed
Tuition (Term 3 portion · 13 weeks)	6,500.00
Bus transport (Route B · return)	850.00
Lunch programme (5 days/week)	600.00
Enrichment & field trips (incl. Bait Al Zubair)	450.00
Books & stationery deposit (refundable)	350.00
Total due	8,750.00

Bank details (display-only, per-school config — NOT parent-writable):

field	value
Beneficiary	International School of Oman LLC
Bank	Bank Muscat
IBAN	OM12 0001 2345 6789 0123 45
Reference (this family)	ISO-ALHABSI-L10

Deferred to P2/P3. The **payment-gateway / portal redirect** (card pay, auto-pay, installment plans managed in-app) is **Phase 2** — that is what the mockup's right-hand portal card depicts. Clean-linkage: the P2 gateway writes back to the same `invoices.status` , so the P1 bank-transfer build needs no migration; only the status *source* changes (file re-upload → webhook).

Open questions.

- **How do schools currently track payments?** (Spreadsheet? PowerSchool finance? A custom system?) Drives the file-upload format Manhaj maps, and whether reconciliation-by-reference-code is realistic for the pilot school. Sales to source.
- Invoice **breakdown** source — confirm the school can supply line items, not just a total.
- Reference-code scheme — per family, per student, or per invoice? (Recommend per student so a 3-child family gets 3 codes.)

4. P6 — Sibling comparison

What it is. A single household view that stacks **all of a parent's children side by side** for the same week — Layla (G10), Omar (G7), Yasmin (G3) — with each child's attendance, homework, latest grade, behaviour, a short highlight, and that child's outstanding action. An AI family-band at the top summarises across all three. It is **read-only**: it reassembles data the other screens already produced, grouped by household instead of by child. The founder is happy with this screen and had no comments — it is documented here as a straight read.

[Open markup full-screen. ↗](#)

What this screen is

- All family digest summarising all children's week in one paragraph
- Per-child cards with colour-coded ribbon, stars, highlights, next action
- Side-by-side comparison strip (attendance, homework, latest grade, behaviour)
- Combined "things needing your attention" with kid-tags
- Family-level items (e.g. combined Term-3 fees across 3 children)
- Deliberate framing: "side by side", not "ranked" -- no sibling competition

What it takes to build this for real

- parent_children join table linking parent → multiple students
- Family-level rollup queries (sum of outstanding invoices, etc.)
- Same data pipelines as individual weekly digest, aggregated
- Visual identity: stable colour per child across all family-view appearances

AI generates the cross-child summary band, identifying common patterns or notable events.

Parent sees all linked children. Children cannot see each other's data (no sibling-view leak).

Who uses it & permissions. Parents with 2+ children at the school, for their own children only. The household is defined by **student_parents** — every student linked to the signed-in parent appears as a card. RLS scopes strictly to that set. Single-child parents are routed straight to P1 instead.

Workflow.

Backend & data linkage.

- **Household resolution.** `student_parents` (existing) is the join: the signed-in parent's `parent_id` → all `student_id`s → one card each. No new table; the screen is a grouping of existing per-child reads.

- **Per-child data** is exactly the P1 read set: `attendance_marks` (the week %), `homework` `assessments` `completion`, latest `assessment_results.score`, `behaviour_notes` `count`, `rubric_scores` /highlight, and the child's single most-urgent open action (`permission_slips` / `invoices`).
- **Family-band AI summary** is one Claude call across all children → one `ai_usage_ledger` row (`request_kind='family_digest'`). It is additive narrative only; no data is written.
- **Compare strip** is a transpose of the per-child stats into one table (attendance / homework / grade / behaviour across children) — pure presentation.
- **Links out.** Each card's action routes to P4 (sign), P5 (pay), or the child's own P1 view. Nothing on P6 writes.

Data tables.

`student_parents` (existing) — the household for Mr Al-Habsi:

parent	student	relationship	is_primary
Mr Al-Habsi	Layla Al-Habsi (G10)	father	true
Mr Al-Habsi	Omar Al-Habsi (G7)	father	true
Mr Al-Habsi	Yasmin Al-Habsi (G3)	father	true

Per-child read (existing tables) — week of 24–28 May, side by side:

child	attendance	homework	latest grade	behaviour	open action
Layla (G10)	100% (5/5)	89% (1 missed)	92% · Maths · Tue	+2 positive	Sign field-trip consent (due Tue 2 Jun)
Omar (G7)	80% (4/5)	95%	88% · Science · Wed	+1 recognition	Sign Term 4 elective form (due Sun 8 Jun)
Yasmin (G3)	100% (5/5)	100% activities	— (highlight: read aloud unaided)	+3 positive	Confirm pickup-person change (Wed)

`ai_usage_ledger` (existing) — one row per family-band summary:

request_kind	model	input_tokens	output_tokens	cost_usd	is_background
family_digest	claude-sonnet-4-6	3,100	300	0.0118	true

Deferred to P2/P3. None — P6 is Phase 1 and read-only. (The per-child "message teacher" pip seen in the mockup belongs to the deferred messaging surfaces — Phase 2/3 — not to P6 itself.)

Open questions. None. (Founder happy; the only dependency is that P1's per-child reads exist, which they do.)

Z. Build & data handover

Task allocation

Build item	Owner role	Why
P1 digest cron (per-family, cadence-driven) + gather pipeline + dual HTML/email render via Resend	Engineer	Scheduled job, multi-table reads, two renderers from one payload.
P1 Claude narrative draft + <code>ai_usage_ledger</code> logging + color-coded "needs attention" flags	Engineer	Claude integration; flag-driven front-end styling.
P1 digest AI cost estimate (Sonnet, ~\$0.10/digest x children x cadence x school)	Hybrid CTO	Sizes the only material AI spend on the parent side; weekly vs monthly cadence multiplies it.
P4 <code>activities</code> table + dropdown-driven form + <code>permission_slips</code> + signed-PDF render	Engineer	New tables, form wiring, deterministic PDF + audit.
P4 <code>student_health</code> table + health-check read/write + trip-teacher summary roll-up	Engineer	New table; becomes the allergy/medical system-of-record (also fixes Teacher T6 open Q).
P5 file-upload ingest → <code>invoices</code> + <code>invoice_lines</code> mapper; bank-details config + reference-code generator	Engineer	One-way map; minimal by design (no gateway in P1).
P6 household resolver (<code>student_parents</code>) + side-by-side render + family-band AI summary	Engineer	Pure read + one Claude call; reuses P1 inputs.
Decide cadence default + pre-review policy with the school	Hybrid CTO + Sales	Cadence (weekly preferred) and whether the school approves digests before send.
Validate digest content, recognition source, trip definitions, and bank/reference scheme with the school	Sales (non-technical)	Direct school access; confirms real workflows and sources the data below.

Data to source from the school

Table / dataset	Fields needed	Source (who/where at school)	Why it's needed / what it feeds
Payments file	per-student invoice no, what-for, amount owed, due date, status	Finance / bursar	P5 ingest → <code>invoices</code> / <code>invoice_lines</code> ;how schools track payments today (OPEN).
Invoice breakdown	line items per invoice (tuition / bus / lunch / trips / deposits)	Finance / bursar	P5 <code>invoice_lines</code> — breakdown must come from the school, not be invented.
School bank details + reference scheme	beneficiary, bank, IBAN, per-family reference-code rule	Finance / bursar	P5 bank-transfer panel (replaces the P2 gateway).
Student health-check data	allergies, conditions, medications, emergency contact, consent	School nurse / safeguarding lead	P4 <code>student_health</code> ;trip-teacher summary; Teacher T6 callouts.
Activity / trip definitions	date, transport, cost, supervision ratio, curriculum link, risk-assessment PDF	Trip-organiser teacher / H&S officer	P4 <code>activities</code> — drives the standardised consent form.
Attendance source	manual daily upload vs teacher T1 entry (or both)	Front office / academic deputy	Determines digest freshness (P1 attendance card).
Recognition system-of-record	where teachers log positive recognitions / incidents	Academic deputy / teachers	P1 timeline pulls recognition from one place, not three (OPEN).
Digest cadence + pre-review policy	weekly vs monthly; approve-before-send yes/no	Principal	One setting drives the P1 cron + the optional review queue.

End of Parent Phase-1 handover. NEW data objects introduced here: `activities` , `permission_slips` , `student_health` , `invoices` , `invoice_lines` (+ display-only bank-details config & per-family reference code). Reused: `comm_drafts` , `consent_records` , `attendance_marks` , `assessment_results` , `behaviour_notes` , `rubric_scores` , `student_parents` , `ai_usage_ledger` , `audit_log` . Deferred: payment gateway (P2), broader activity sign-up incl. student self-signup (P2), feedback/raise-an-issue (deferred, separate visual), parent inbox/messages (P3), direct-teacher message (P2/3), PTA volunteer (P3).
